RUBBER ISOLATOR REMOVAL DIAGRAM

This technique can be used if an Exhaust Hanger Removal Pliers is not available.

Using a 5/8" open end wrench, slide the wrench up to the rubber isolator, cradling the hanger rod as shown. Next place the flat edge of a pry bar between the wrench and the hanger stop or hanger rod. Then simply rotate the pry bar toward the wrench to remove the rubber isolator.

Note: Using a spray lubricant or soapy water on the hanger rod and the rubber isolator helps removal.

WELDNUT CLEANING

To remove debris from weldnuts in frame, spray lubricant or compressed air into hole. For heavy debris, use a small wire brush. (Be careful not to damage threads).

1. Lower exhaust by removing the (4) 8mm bolts from the muffler brackets and the forward rubber isolator. Return the (4) 8mm bolts to the owner.

2. Remove the (1) fastener securing the heat shield to the bottom of the driver side frame rail. Trim the portion of the heat shield covering the mounting areas of the driver and passenger side frame rails, see trim diagram. After trimming re-attach the heat shield to the bottom of the driver side.

3. Enlarge the access holes to allow 7/16" carriage bolts to pass through. Reverse fishwire the 7/16" carriage bolt and SP7 spacer in the enlarged access hole, both sides. **Note:** Leave fishwires attached to prevent loss into the frame rails. Push the side fasteners back into the frame rail prior to raising the hitch into position.

4. Slide the hitch in from the rear passenger side of the vehicle over the exhaust and into position. **Note:** Feed the fishwires through the mounting holes while raising the hitch.

5. Remove the fishwires from the carriage bolts in the bottom of the frame rails and loosely secure the hitch with 7/16" flange nuts. Pull the fishwires through the side mounting holes and loosely secure them with 7/16" flange nuts. Re-attach the muffler brackets to the bottom of the hitch into the original mounting holes using the provided M8-1.25 hex bolts and 5/16" washers.
