MN-339 (02908) ECN2743

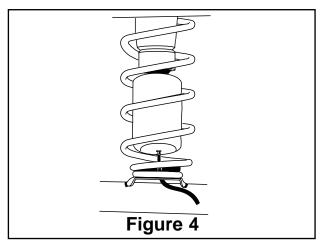

AIRLIFT 1000

- 1. Jack up rear of vehicle or raise on hoist. Support frame with safety stands. Lower axle or raise body of vehicle until suspension is fully extended.
- 2. The coil springs must be removed for this installation:
 - Detach the shock absorbers at the lower shock mount.
 - b. Carefully lower the axle until the coil springs are free. Do not strain brake lines. Mark the position of the cut end of the coil spring on the upper spring seat so that coil springs can be reinstalled in the same position. Remove coil springs.
- Cut off exposed portion of rubber jounce bumper (Figure 1).
- 4. If there is no open hole in bottom spring retainer for hose routing, drill a 9/16" hole in the center of the jounce bumper strike plate that is sticking up (Figure 2).
- 5. User may select either Dual Air Line or Tee Air line option depending on use of vehicle. Tee Air Line installation is recommended unless weight in vehicle varies from one side to the other, in which case Dual Air Line installation is recommended to level the vehicle side to side (See Air Line Installation instructions to prep air springs before continuing).
- 6. Insert the provided protector into the lower spring seat (Figure 3).
- 7. Insert the air cylinders into the coil springs with air lines hanging down.
- 8. Thread the air line through the hole in the lower spring seat, routing the line to the side of the axle (front or rear) on which the inflation valves will be mounted.
- Reinstall the coil springs in the vehicle. Be sure to line up the cut end of the upper coil spring with your mark on the upper spring seat. Carefully raise the axle to seat the springs.
- 10. Reattach all components disconnected under step 2:
- 11. Continue with air line installation instructions.

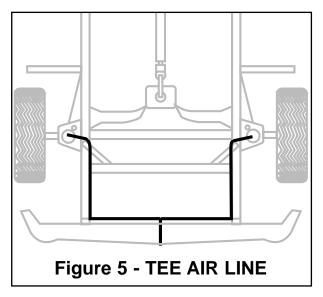

AIR LINE INSTRUCTIONS

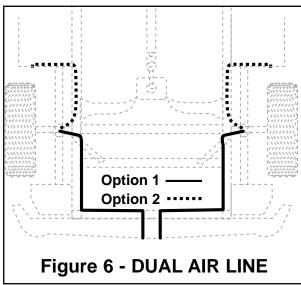

CAUTION: LEAVE SUFFICIENT AIR LINE SLACK TO PREVENT ANY STRAIN ON FITTINGS DURING AXLE MOTIONS.

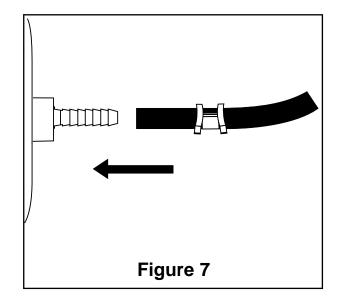

TO PREVENT AIR LINE FROM MELTING, KEEP IT AT TWELVE INCHES FROM EXHAUST LEAST SYSTEM. ENGINE AND **HEAT** SOURCES. CAUTION: AVOID AREAS WHICH MAY CAUSE FAILURE OF THE AIR LINE. FOR EXAMPLE: BATTERY, EXHAUST, ENGINE, AND MOVING PARTS SUCH AS STEERING, SUSPENSION AND CABLES.

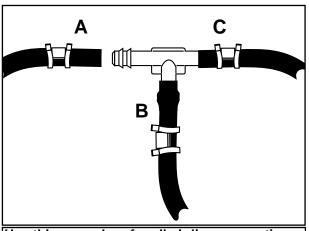

TEE AIR LINE CONNECTION:

- A. Find desired tee location on the frame rail or radiator core support bracket (Figure 5).
- B. Determine and cut adequate length of air line to reach from tee to left and right side on air cylinders.
- C. Connect the air line to the two opposite legs on the tee (Figure 8).
- D. Route air line to left and right air springs, generally along inner fender panel or frame rails.
- E. Slide air line clamp onto the air line. Push the air line over the barbed end of air cylinder. Compress the ears on the air line clamp with pliers and slide it down to cover the barbed section (Figure 7). Repeat for other side.
- G. Select a location for inflation valve in the hood release, front bumper, fender flange or behind the license plate, ensuring that the valve will be protected and accessible with an air hose.
- H. Connect the remaining air line over the last fitting on tee and route along frame to desired inflation valve location. Attach air line to chassis with provided plastic straps.
- I. Drill a 5/16" hole for inflation valve and mount as illustrated (Rubber washer is for outside weather seal (Figure 9).
- J. Connect the air line to the inflation valve.
- K. Continue with step 11.

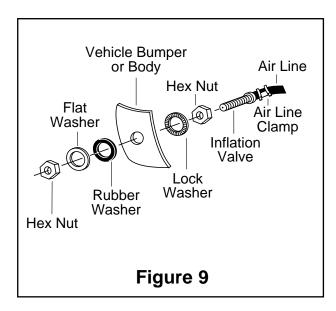

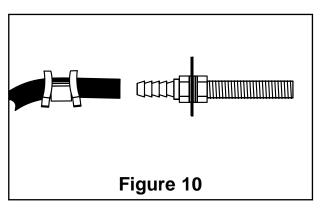

Use this procedure for all air line connections:

- A. Slide air line clamp onto the air line
- B. Push the air line over the barbed stem.
- C. Compress the ears on the air line clamp with pliers and slide it forward to fully cover the barbed section.

Figure 8

DUAL AIR LINE CONNECTION:

- A. Select a location for the inflation valves in the rocker panel flange or by hood release insuring that each valve will be protected and accessible with an hose.
- B. Determine and cut adequate length, not longer than 90" of air line to reach from valve location to left side air cylinder.
- C. Slide air line clamp onto the air line. Push the air line over the barbed end of straight fitting. Compress the ears on the air line clamp with pliers and slide it down to cover the barbed section (Figure 8). Repeat for other side.
- D. Route air line along frame or under fender panel to desired inflation valve location (Figure 6). Attach air line to chassis with plastic straps or wire.
- F. Drill 5/16" hole for inflating valves and mount as illustrated (Rubber washer is for outside weather seal, Figure 9).
- G. Connect the air line to the inflation valve.
- H. Repeat process for right side.
- I. Continue with step 11.
- 11. Inflate Air Springs to 35 psi. Check for air leaks at all fittings and valve core with a soapy water solution.
- 12. Replace wheels, remove safety stands and carefully lower vehicle to ground.
- 13. Deflate Air Springs in 5 psi. intervals to determine best ride and handing. Sufficient air pressure should be maintained to help prevent bottoming-out on large bumps, chuck holes, etc
- 14. Recheck air pressure after 24 hours. A 2-4 psi loss is normal after initial installation. If the pressure has dropped more than 5 psi re-test for leaks with a soapy water solution. Please read and follow the Maintenance and Operation Tips on page 4.

FAILURE TO MAINTAIN MINIMUM PRESSURE WILL VOID THE WARRANTY

MINIMUM AIR PRESSURE 5 PSI

MAXIMUM AIR PRESSURE 35 PSI

MAINTENANCE TIPS:

- 1. Check pressure weekly!
- 2. Always maintain at least 5 psi air pressure chafing or coil pinch.
- 3. If you develop an air leak in the system, use a soapy solution to check all air line connections and the valve core before removing cylinder.

OPERATING TIPS:

- 1. Inflate your air springs to 35 psi before adding the payload. After vehicle is loaded, adjust your air pressure (down) to level the vehicle and for ride comfort.
- 2. Check your tire pressures and inflate according to manufacturers recommendations.

Thank you for purchasing Air Lift Products
